**Community Ambient Air Quality Monitoring Programme Report
Quarter 4, 2015**

Overview of Monitoring Programme

MVV started ambient air quality monitoring in the vicinity of the EfW CHP Facility in August 2014. Two pollutants are measured in the on-going survey, Nitrogen Dioxide (NO₂) and particulate matter (as PM₁₀). Monitoring of NO₂ is carried out at ten locations in the area, while a PM₁₀ real time monitoring station has been installed in the vicinity of Camels Head junction and began monitoring in October 2014.

Nitrogen Dioxide

Oxides of nitrogen (NO_x) are formed at the high temperatures and pressures found within vehicle engines and other combustion processes. Some of the nitrogen in the air and the fuel, mainly in the form of nitric oxide (NO), is oxidised to form NO₂ in the atmosphere. NO₂ is associated with adverse effects on human health and it is this pollutant for which air quality standards have been set in the UK and elsewhere within the EU.

Diffusion tubes are used to measure levels of NO₂ within an area. These are small plastic tubes containing a chemical absorbent which reacts with NO₂ present in the air. The tubes are changed each month and then sent away to a laboratory for analysis. The results give a NO₂ level for each calendar month and these are used to derive an annual average which can be compared against the National Standards annual average air quality objective.

Particulate Matter

Particulates, alternatively referred to as particulate matter (PM), are tiny solid particles or liquid droplets suspended in a gas. Sources of particulate matter can be man-made or natural. Concentrations of particulate matter within the air can be expressed in terms of their size, for example PM₁₀ represents particles of 10 µm diameter or less. PM₁₀ occurs naturally, originating from volcanoes, dust storms, forest and grassland fires, living vegetation and sea spray. Human activities also generate PM₁₀, from sources such as road transport, power plants, agriculture, various industrial processes and local domestic heating.

A specialised air quality monitoring unit measures small particles of matter as they are drawn into the machine. The dust particles pass through a light, from a long life LED source, and as they do so generate a scattered light impulse. Measuring the deflection and intensity of this light impulse allows the size and number of particles to be detected. Measurement is continuous and a result is generated every five minutes. These results allow a daily average to be generated from which an annual average can be determined, both of these figures can then be compared to the National Standards.

Locations

The NO₂ monitoring sites have been divided between the area around the Camels Head junction (which could potentially be affected by emissions from site-related road traffic) and other locations representative of the urban background in St Budeaux and King's Tamerton (which could be affected by emissions of NO₂ from the main chimney of the EfW CHP Facility). The PM₁₀ real time monitor is located in the vicinity of Camels Head junction.

National Standards

The national air quality objective values, against which the monitoring results are compared, are shown in the Table below:

AIR QUALITY OBJECTIVES SET IN UK REGULATIONS			
Pollutant	Averaging Period	Objective Value ($\mu\text{g}/\text{m}^3$)	Maximum Permitted Exceedances
Nitrogen dioxide(NO_2)	Annual average	40	None
	Hourly average	200	18 hours per year
Particulate matter(PM_{10})	Annual average	40	None
	Daily average	50	35 days per year

2015 Quarter 4

This quarterly update presents the results of monitoring carried out during October, November and December 2015.

1. Operational or Other Activity

During this time, the EfW CHP facility was operational.

2. NO₂ Diffusion Tubes

Oct: 10 tubes deployed 02/10/2015, 10 recovered 11/11/2015, date of report 25/11/2015

Nov: 10 tubes deployed 11/11/2015, 10 recovered 07/12/2015, date of report 16/12/2015

Dec: 10 tubes deployed 07/12/2015, 10 recovered 06/01/2016, date of report 25/01/2016

3. PM₁₀ Monitor maintenance, service or down time

Monitor fully operational, except during service.

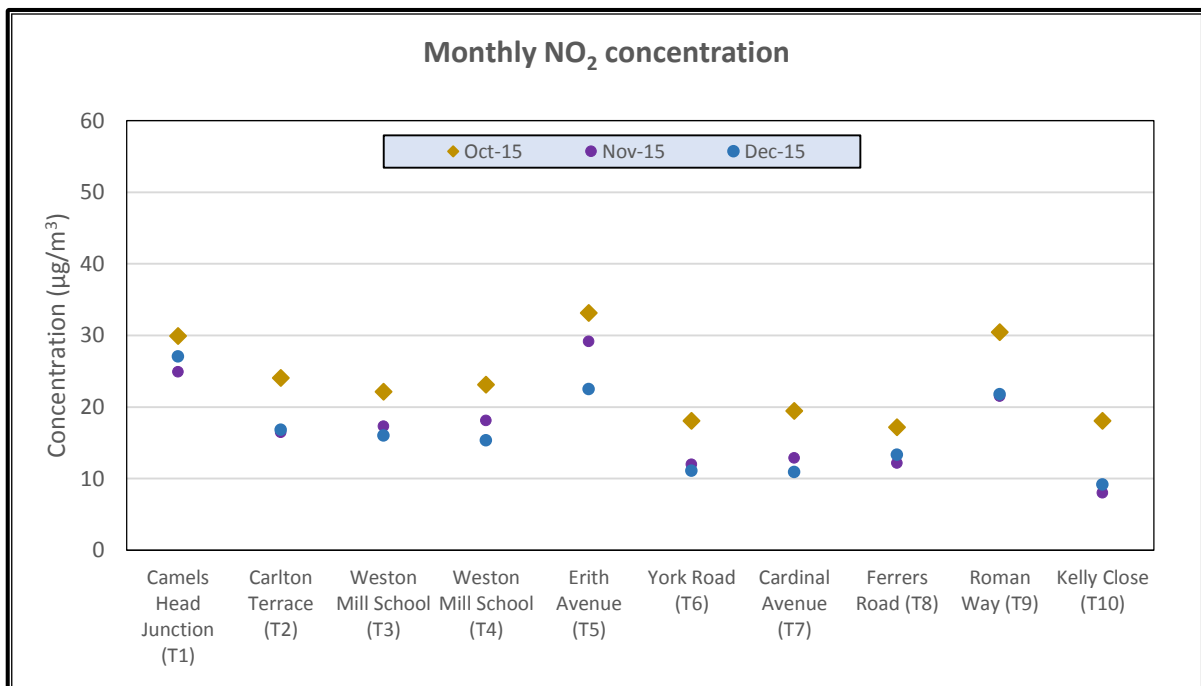

No service or down time during this reporting period.

4. NO₂ Diffusion Tube Monitoring

Note: Results shown include an adjustment for laboratory blank but are provisional until bias adjustment has taken place.

Three Monthly Monitoring.

The results of the monitoring for the three-month period October to December 2015 are shown in the graph below.

Summary of Results

A summary of results to date are shown in the Table below where the rolling 12-month average can be directly compared with the Annual Air Quality mean objective. The mean concentrations of all results to date are seen to be within the air quality objective of 40 µg/m³ at all the monitoring sites.

5. PM10 Monitoring

Hourly PM10 Concentrations

24-hour PM10 Concentrations

Summary of Results

A summary of results to date are shown in the table below. The mean concentrations to date are seen, with one exception, to be within the AQS annual air quality mean objective of 40 µg/m³.

The highest individual value was recorded in December, when the daily average for Sunday 27th December exceeded the AQS 24-hour average of 50 µg/m³. This coincides with poor air quality across the whole of southern Britain, as verified by DEFRA:

<https://uk-air.defra.gov.uk/data/DAQI-regional-data>

Once on their website, it is possible to select dates of interest to check local and national data. A description of the colours is given in their 'air pollution index'.

Actual chimney emission data for our Facility is published weekly on our website:

http://www.mvv-environment.co.uk/en/swdwp_devonport/links_and_downloads/links_and_downloads.jsp

Data capture for October, November and December 2015 was 100%.

PM ₁₀ MONITORING AT THE CAMELS HEAD JUNCTION		
Results October - December 2015		
Minimum recorded value	(µg/m ³)	0.906
Maximum recorded value	(µg/m ³)	121.5
Average	(µg/m ³)	15.527
Standard deviation	(µg/m ³)	11.322
Data Capture	(%)	100
Number of 24-hour periods with average above 50 (µg/m ³)		1
Summary		
Rolling average (all months)	(µg/m ³)	12.485
Rolling average (last 12 months)	(µg/m ³)	n/a
2014*	Average	15.23
	Number of 24-hour periods with average >50 (µg/m ³)	0
2015	Average	12.615
	Number of 24-hour periods with average >50 (µg/m ³)	1
2016	Average	
	Number of 24-hour periods with average >50 (µg/m ³)	
2017	Average	
	Number of 24-hour periods with average >50 (µg/m ³)
